

Nitrogen prices are high making it even more critical to right-size application rates this year. Overapplying nitrogen adds unnecessary costs, while underapplying risks yield. Getting nitrogen right is one of the most effective ways to protect profitability this season. While every operation is different, the goal is the same: optimize input costs without sacrificing yield—especially in a high-cost nitrogen market.

Rosetree Consulting is offering FREE Advanced (In-Season) Nitrogen Management for corn acres with injected manure within Pennsylvania's Chesapeake Bay watershed, helping you maximize nutrient value and make more confident nitrogen decisions.

So what are the steps for participation? It's Easy!

- Work with Rosetree to determine which of your acres are eligible
 - Acres must be within the Chesapeake Bay Watershed (see map above)
 - Injection must have been performed on acreage in 2026 growing season
- Complete the enrollment paperwork (with the assistance of Rosetree) by May 15

What's included for participating farms?

- Free Manure Management Plan review to ensure it is current. No cost Manure Management Plan updates for enrolled acres, as needed
- Free access to Adapt-N Modeling. This platform provides real-time, field-specific data about in-season N needs, N loss pathways, etc.
- Right-sized sidedress N recommendations (based on Adapt-N data) to ensure yields are maximized and costs are kept in check
- Bi-weekly check-ins with / data from the Rosetree team to help you understand the data provided by these platforms and make appropriate, data-driven decisions

Call or email Julia Neideigh at Rosetree Consulting for additional information on how you can participate in this FREE project.
